I've been working on integrating the user functionality with other functionalities in our mini Amazon project. For example, I've hooked up the user profile display to a new API endpoint for getting products for a specific user from a specific date, and I've set up a function addBalance to be used by purchases and products endpoints that need to change a user's balance (for example, after a new purchase), and checks that transactions are valid.

I have been thinking about how we will get our "plus points," testing different aesthetic changes and a couple additional features in a separate branch. These features include a better purchase button (since right now you have to manually type in what you want to purchase), as well as including product images.

Working on adding endpoints and links to cart items that link to seller page for each product. Also working on adding a pop-up whenever a user adds to their cart asking for the quantity of the product. Finally, added a function to remove products from the cart.

Implemented combined table for all reviews. Working on links to a singular review page, allowing all reviews to be seen. Working on allowing for more fleshed out review other than a score.
